Solid. Secure. Straightforward.

TetherX Paxton Integration

Monitor

Real-time information & detect issues

Manage

Unlock doors, make changes

Automate

Advanced rules, automations

System Requirements

TetherX only integrate with Net2 at present. The minimum version required is **6.01 or newer** of Paxton Net2 Access Control.

Paxton do not at present provide an API in order to integrate with Paxton10.

Basic Integration

The basic integration allows searching Tether generated events by a person's name, to find all events where a specific person used the access control system.

It also allows seeing all event information in context, with the person's details, corresponding video surveillance, time-lapse images, audit information and more.

Advanced Integration

Depending on the project requirements, we can do advanced automations and interactions between different devices, some examples include:

- Disarm a Texecom alarm when a person uses their Paxton token to enter a building.
- By-pass a Texecom alarm zone when a person enters a specific code on a Paxton keypad.
- Send a push/email alert with a photograph when a specific person enters a building.

Please get in touch with TetherX about your project requirements.
